💼 PROJECTS

Docsera: A Smart Medical Appointment Management

1. **Platform with Intelligent Assistant**

Engineered an intelligent healthcare scheduling platform integrating an AIpowered chatbot to handle patient inquiries, appointment bookings, and automated reminders. Developed secure, role-based portals for patients, doctors, and administrators to streamline communication and reduce scheduling conflicts. Built with ASP.NET Core Web API, Next.js (React), MySQL, and Tailwind CSS, ensuring scalability, security, and responsive design. Leveraged n8n for workflow automation and conducted comprehensive system testing to validate performance and reliability

2. **ExploreXpress: Seamless Travel Booking Web Application**

ExploreXpress is a travel booking web application built using ASP.NET that enables users to book flights, hotels, and rental cars through a single platform. The system focuses on a seamless user experience, efficient booking management, and scalable web application design.

3. **War of Words (Worldle-like game)**

War of Words – A Wordle-like puzzle game developed in Java, utilizing core data structures such as arrays, lists, and hash maps. The game features:
- Object-oriented design with multiple Java classes managing game logic, player input, and scoring.
- Efficient storage and retrieval of words using data structures for fast access and validation.
- Implementation of algorithms to check guesses, provide hints, and manage game state.
- A fully interactive console-based interface demonstrating clean and maintainable code.

This project highlights strong Java programming skills, algorithmic thinking, and the ability to design interactive, logic-based applications
